Subject:

Staff Report

Palmberg Paving Site

448 McCormick Gardens Road

Gearhart, Oregon ECSI #3262

Introduction

This Staff Report presents the basis for the Oregon Department of Environmental Quality's (DEQ's) proposed no further action (NFA) finding for an investigation and soil cleanup at property located at 448 McCormick Gardens Road in Gearhart, Oregon (Figure 1).

Bill Palmberg Jr., the property owner, originally entered DEQ's Voluntary Cleanup Program (VCP) under the Independent Cleanup Pathway (ICP) on January 10, 2002, by signing an agreement for DEQ technical consultation and oversight during a site investigation and cleanup. The results of the investigation and soil cleanup summary were presented in an *Independent Cleanup Pathway Final Report* dated September 16, 2003 (Tim O'Gara, 2003a). Based on DEQ's review of the report and other file information a NFA determination was issued by DEQ on January 5, 2004. DEQ evaluated the site under industrial and occupational risk scenarios, and did not consider residential use based on land use information provide by Mr. Palmberg.

On February 6, 2006 Mr. Palmberg entered into a Letter Agreement with DEQ to provide additional review and oversight of field work to determine if the site was protective for residential use. The subsequent field investigation was documented in a report dated September 1, 2006 (O'Gara, 2006) and additional correspondence (O'Gara, 2006a, 2006b). Based on a review of this report DEQ concluded that the majority of the site, with the exception of tax lot 1000, did not present a significant threat to human health or the environment. DEQ determined issued a conditional NFA dated December 20, 2006. The NFA applied to all tax lots comprising the site with the exception of tax lot 1000 due to residual contamination in site soil at levels exceeding residential risk-based standards and inadequate sampling coverage on this tax lot.

Additional sampling described below was conducted to complete the site characterization and to determine the extent of contamination on tax lot 1000.

Palmberg Paving - Staff Report Page 2 of 6 October 9, 2007

The site was previously determined by DEQ to be protective of beneficial groundwater use and for wildlife at the site. Because the change of proposed site use to residential does not affect these conclusions, additional investigation focused on verifying the extent of contamination in soil. Accordingly, this Staff Report and risk evaluation herein focuses on residential exposure to soil contaminants on tax lot 1000.

Site background information and the risk evaluation for other media under an occupational exposure scenario is contained in DEQ's Staff Report dated November 4, 2003.

Site Location and Operational History

The entire site covers 27.36 acres of relatively flat land approximately 0.5 miles east of the Pacific Ocean, in Township 6 North (T6N), Range 10 West (R10W), Section 3. The northern portion of the site is occupied by remnants of the former Palmberg Paving Company, Inc. (PPCI). The site is comprised of 11 tax lots (Figure 2). An approximately 4.8 acre man-made lake is located in the south central portion of the site (Figure 3). Tax lot 1000 is approximately 5 acres in the east-central portion of the site. It was used by an automobile wrecking company from 1958 to 1960. A sand and gravel mining operation occupied the central site area in the early to mid 1960s. The quarry created by the mining operation filled with groundwater, resulting in the present day lake. The discharge from the lake is piped to the south beneath the adjacent roadway and discharges to a drainage that flows to the Pacific Ocean.

The site area has been mapped as a seasonally flooded Palustrine forested wetland. Most of the trees at the site were removed during mining activities, and the site is now largely covered with grass.

Beneficial Land Use

The site is currently vacant, with the exception of dumpsters being stored on paved areas in the north part of the site. With the exception of the access road extending to the west, which is zoned R-2 (medium density housing), the entire site is zoned RA (rural agriculture), which allows one residential dwelling per acre. The site is bounded by residential properties to the southeast and to the north. Based on the extent of contamination, the locality of facility is contained completely within the property boundary.

Mr. Palmberg has indicated he wishes to utilize the property for residential purposes. There are indications that wetland areas are present at the site, but they are located some distance from the impacted site areas. Areas adjacent to the lake, and the lake itself provides ecological habitat for mammals (e.g., deer, raccoon) migratory waterfowl and songbirds. It is reported by the owner that the lake has been stocked and provides recreational fishing.

Palmberg Paving - Staff L., ort Page 3 of 6 October 9, 2007

Previous Site Investigations on Tax Lot 1000

Phase 1 and Phase 2 Site Investigations

A Phase 1 and Phase 2 investigation was conducted on behalf of the City of Gearhart (City) in 2001 (Peratrovich, Nottingham & Drage, Inc., 2001). The Phase 1 assessment identified the three former asphalt plant areas, the former wrecking yard, and an equipment cleaning area. During the Phase 2 investigation six test pits were advanced in the wrecking yard area. Upon encountering household and automotive-related solid waste the investigation was terminated. It does not appear that any samples were submitted for laboratory analysis.

Expanded Preliminary Assessment (Clearwater Environmental Services, 2002)

Clearwater Environmental Services (CES) conducted an Expanded Preliminary Assessment (XPA) in June 2002 (CES, 2002). The scope of work included excavating 5 test pits on tax lot 1000 (Figure 3). Total petroleum hydrocarbon (TPH) and polycyclic aromatic hydrocarbons (PAHs were not detected in any of these 5 samples.

Metals were detected at levels within the range of expected naturally occurring concentrations.

June and September 2006 Investigation (O'Gara 2006a, 2006b)

Sampling was conducted in the former automobile wrecking yard to provide better sampling coverage and to refine the nature and extent of contamination Eight borings were advanced in the wrecking yard area (GP-E through GP-L; Figure 3).

Sampling locations were selected to provide a sampling transect in the vicinity of previous test pits AW-1 and AW-3 where car parts and other anthropogenic debris had been observed. Subsequently an additional six shallow (<1 foot) soil samples (AW1-1, AW-1-20-west, AW-2-1, AW-3-20-east) were collected on September 28, 2006.

Sample I-2 was the only sample in the wrecking yard area with contaminant concentrations above risk-based levels for residential exposure. Benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene and lead exceeded the RBC for direct contact under a residential exposure scenario (Tables 1, 2 and 3).

The TPH-oil concentration in I-2 (4,910 mg/kg) exceeds the DEQ UST Program Level II Soil Matrix Cleanup Standard (500 mg/kg) and the TPH-D RBC for residential exposure (3,900), which is considered a conservative screening concentration for TPH-oil.

Current Investigation: September 2007 Sampling

DEQ required additional field work to complete the characterization for tax lot 1000, including accurately locating historical sample stations, and collection of additional soil

Palmberg Paving - Staff Report Page 4 of 6 October 9, 2007

samples to provide better sampling coverage of tax lot 1000. Six test pits were advanced (TP-A through TP-F; Figure 3). One sample was collected from each test for laboratory analysis of TPH, PAHs and lead. All samples yielded non-detect results at sufficiently low detection limits.

Risk Evaluation

Sample concentrations were compared to DEQ's generic risk-based concentration (RBCs) for exposure to soil contaminants under a residential exposure scenario.

Sample I-2 is the only sample in the wrecking yard area with contaminant concentrations above risk-based levels for residential exposure. Benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene and lead exceeded the RBC for direct contact under a residential exposure scenario, and were identified as contaminants of potential concern (COPCs). Concentrations of these analytes were less than 10 times their respective RBCs.

The TPH-oil concentration in I-2 (4,910 mg/kg) exceeds the TPH-D RBC for residential exposure (3,900), which is considered a conservative screening concentration for TPH-oil. TPH-oil also was identified as a COPC.

The highest residual TPH-D concentration in soil (2,490 mg/kg) is below the RBC for direct contact under a residential scenario and was not identified as a COPC.

To assess the potential risk attributable to these detections from the former wrecking yard on tax lot 1000, DEQ calculated the 90% upper confidence limit (UCL) of the mean for each COPC using the United States Environmental Protection Agency (EPA) ProUCL (v.4.0) software. ProUCL spreadsheets are included as Appendix A.

The resulting concentrations are considered suitable exposure point concentrations (EPCs) based on reasonable maximum exposure (RME), and were compared to human health screening criteria.

The results were as follows:

	$90\% \mathrm{UCL}^1$	RBC (direct contact-residential)
TPH-oil	1,330 mg/kg	3,900 mg/kg
benzo(a)pyrene	0.226 mg/kg	0.062 mg/kg
benzo(b)fluoranthene	0.336 mg/kg	0.62 mg/kg
dibenz(a,h)anthracene	0.0421 mg/kg	0.062 mg/kg
lead	328.7 mg/kg	400 mg/kg

¹ Because the data distribution was not normal or lognormal, various non-parametric values for the 90% UCL were considered. Based on the hierarchy of preferred methods per the ProUCL Version 4 Users Guide, the 90% UCL derived from the Chebyshev method was selected for the EPC.

Palmberg Paving - Staff Report Page 5 of 6 October 9, 2007

Benzo(a)pyrene is the only contaminant with an EPC above its RBC. Despite the fact that benzo(a)pyrene only was detected in one sample, and relatively low detection limits were achieved, the resulting EPC exceeds its RBC by a factor of about 3.5.

Discussion

To further assess the potential risk posed by benzo(a)pyrene, its estimated lateral extent in soil was compared to a hypothetical 1-acre lot located on the wrecking yard footprint. The extent of contamination, based on surrounding samples, was assumed to be a circle with a radius of 25 feet around GP-I (Figure 2), corresponding to approximately 2000 square feet (ft²). Assuming a one-acre lot containing I-2, the percentage of soil impacted above RBCs for a 1 acre lot is:

 $2000 \text{ ft}^2/43,000 \text{ ft}^2 \times 100 = 4\%$

For evaluating risk over the 1 acre exposure interval it is assumed that a resident will spend equal time over the entire 1-acre lot during the course of their exposure duration. In this case, given the localized occurrence of benzo(a)pyrene, a resident would be exposed to contamination around I-2 only 4 % of the time. Thus an RBC based on exposure over the entire 1-acre lot over predicts the risk to a resident posed by the limited contamination.

Based on the limited detection of benzo(a)pyrene, the localized area impacted above RBCs, the probability of residential exposure to contaminated soil for a period of time that would result in an unacceptable risk appears low.

Recommendation

DEQ reviewed the existing environmental information for the site and concluded that the site does not present a significant threat to human health or the environment, and that a no further action (NFA) is warranted. The proposed NFA finding is consistent with Oregon Revised Statutes (ORS) 465.200 through 465.455 and Oregon Administrative Rules (OAR) Chapter 340, Division 122, Sections 010 to 115.

There are localized areas of residual soil contamination in the PCCI operational areas of the site and tax lot 1000. Soil from these areas is solid waste and needs to be managed accordingly. Should it be excavated or otherwise disturbed during development it needs to be characterized and managed according to all applicable local, County, State and Federal regulations.

DEQ's previously approved the soil removal action in the earlier NFA determination following a public comment period. Therefore an additional public comment period is not required.

I request you approve my recommendation to issue a NFA determination.
